Victoria N. Locke, Ph.D.

Istation

### Abstract

This study provides the correlational relationship between Istation's Indicators of Progress Early Reading (ISIP<sup>™</sup> ER) and State of Texas Assessments of Academic Readiness (STAAR) Reading scores. The data came from students in a large school district in the Houston area. The Pearson product-moment correlations are applied between the middle-of-the-year (MOY) ISIP ER scores of kindergarten, first grade, second grade, and third grade students and STAAR Reading scores in the same students' third grade year and between the end-of-the-year (EOY) ISIP ER scores of kindergarten, first grade, second grade, and third grade students and STAAR Reading scores in the same students' third grade year. Results show a strong relationship between ISIP ER and STAAR Reading scores.

This study also provides the proficiency projection of the EOY ISIP ER for second grade students and STAAR Reading in third grade and MOY ISIP ER for third grade students and STAAR Reading in third grade. Students in the study were in third grade in the 2018-2019 academic year and in second grade in the 2017-2018 academic year. Multinomial logistic regression analysis is applied. The ISIP scores are the predictor, and the STAAR Reading performance levels 2, 3, and 4 are the outcome variable. Results show that second and third grade students need to achieve ISIP scores near the 45th percentile rank or higher to have a medium probability of passing the STAAR Reading (performance level 3 or higher). They need to achieve ISIP scores near the 70th percentile rank or higher to have a medium probability of reaching the STAAR Reading performance level 4 – Masters.

# Introduction

Istation's Indicators of Progress (ISIP) Reading assessments use a web-delivered computer-adaptive testing (CAT) system. They are built using two-parameter Item Response Theory and driven by a fully CAT algorithm. ISIP gathers and reports frequent information about student progress in the critical domains throughout and across academic years (Patarapichayatham et al., 2013). ISIP accomplishes this by delivering monthly tests that target critical areas to inform instruction. With adequate computer resources, it is possible to administer ISIP assessments to an entire classroom, school, or district in a single day. Student results illustrating each student's past and present performance and skill growth are immediately available online for teachers and administrators. Teachers are alerted when students are not making adequate progress so that the instructional program can be modified before a pattern of failure becomes established (Mathes, 2011).

The purpose of ISIP Reading is to measure reading ability and identify deficits in critical areas to provide continuous differentiated instruction. ISIP ER is available for prekindergarten through 3rd grade, and ISIP Advanced Reading (AR) is available for students in 4th through 8th grade. ISIP provides teachers and other school personnel with easy-to-interpret, web-based reports that detail student strengths and deficits and provide links to teaching resources and targeted intervention strategies (Istation, 2018).

Texas public school students take the State of Texas Assessments of Academic Readiness (STAAR) tests in grades 3 through 8 and high school. STAAR tests are aligned to the Texas Essential Knowledge and Skills (TEKS) learning standards. The Texas state standards define what Texas students should learn in each grade level. STAAR test results provide useful information for parents, teachers, and administrators on students' academic performance in reading, math, writing, science, and social studies.

This study aims to evaluate the relationship between ISIP ER and STAAR Reading scores. Research on ISIP ER consistently demonstrates a strong relationship between ISIP ER and state assessments including the ACT Aspire (Patarapichayatham, 2020), the Idaho Standards Achievement Test (Wolf & Ross, 2020), the PARCC (Cook & Ross, 2020), the Virginia Standards of Learning (Campbell et al., 2019), the Colorado Measure of Academic Success (Patarapichayatham, 2019), and the Ohio AIR (LePlante, 2018).

There are two main parts in this study. First, the correlational relationships between ISIP ER and STAAR Reading scores are analyzed using Pearson productmoment correlations. Second, we provide a linking study between ISIP ER and STAAR Reading scores. Since students in third grade take STAAR Reading in spring, we wanted to find the relationships between ISIP ER and STAAR Reading at the end of their second grade year, using April as the benchmark month, and at the middle of their third grade year in using January scores, to see if these benchmarks can be used to prepare students for the STAAR. The end-of the year (EOY) ISIP scores for second grade from April and the middle-of-the-year (MOY) ISIP scores for third grade were predictors, and STAAR performance levels (Approaches, Meets, and Masters) were the outcome variables. Note that a sample in each study might be different depending on a purpose of the study.

# **Part I: Correlational Study**

Part I of this study aims to evaluate the relationship between ISIP ER and STAAR Reading scores. The Pearson product-moment correlations are applied between (a) January MOY ISIP ER scores of kindergarten, first grade, second grade, and third grade and STAAR Reading scores in the same students' third grade year and between (b) April EOY ISIP ER scores of kindergarten, first grade, second grade, and third grade, and STAAR Reading scores in the same students' third grade year.

#### Measures

This study uses the ISIP ER and STAAR Reading tests, and the correlational analysis uses the overall reading ability scaled scores. In ISIP ER, as students master lower-level skills, they progress to more difficult skills, so in each grade, different subtests comprise the overall ISIP ER score. In kindergarten, the overall scores are computed based on the Listening Comprehension, Phonemic Awareness, Letter Knowledge, and Vocabulary subtests. In first grade, the overall scores are computed from the Phonemic Awareness, Letter Knowledge, Alphabetic Decoding, Reading Comprehension, Spelling, and Vocabulary subtests. In second and third grades, the overall scores are computed from the Reading Comprehension, Spelling, and Vocabulary subtests.

### Sample

The sample came a large school district in the Houston metropolitan area. The district is approximately 44% Hispanic or Latino, 18% Asian, 27% Black or African American, and 10% White (NCES, 2018). Approximately twenty eight percent (28.5%)

of families in the district have incomes below the poverty level. We evaluated the cohort of students who were in third grade in the 2018-2019 school year and took the STAAR Reading test in spring 2019. This cohort was in the second grade in the 2017-2018 school year, first grade in 2016-2017, and kindergarten in 2015-2016. These students took the ISIP ER assessment as a benchmarking assessment. The original data file had 3,410 third grade students in the 2018-2019 school year who had STAAR Reading scores. Since this study aims to investigate the relationship between ISIP ER and STAAR Reading scores from kindergarten to third grade, only the same students from kindergarten to third grade were included in the correlation analysis. Students used the Istation program in all grades. A total of 837 students were included in the correlational study.

Table 1 shows the mean and standard deviation of the ISIP ER and STAAR Reading scores. Students in kindergarten gained approximately 10 ISIP scaled score points from the MOY to EOY assessment months. Students gained approximately 10, 6, and 4 ISIP scaled score points from the winter benchmarking assessment month to the spring benchmarking assessment month in first, second, and third grade, respectively. The STAAR Reading mean score was 1,448 with the standard deviation of 148.

Table 2 shows the demographics of the sample. Half of these students were female students. Approximately 34% of the total were Hispanic/Latino, 36% were African American, 25% were Asian or other race/ethnicities, 4% were White. Students who were limited English proficient comprised 50% of the sample. Forty-two percent (42.2%) were English as second language (ESL) students and 3% were identified as having dyslexia. Eight percent (8.2%) were enrolled in a special education program, and

10% were identified as gifted. Approximately 75% of the sample met STAAR Reading Approaches, 45% met STAAR Reading Meets, and 30% met STAAR Reading Masters in spring 2019.

| Grade        | Assessment    | Mean     | SD     |
|--------------|---------------|----------|--------|
| Kindergarten | ISIP MOY      | 190.50   | 14.23  |
|              | ISIP EOY      | 199.87   | 15.16  |
| First        | ISIP MOY      | 213.12   | 16.22  |
|              | ISIP EOY      | 222.63   | 16.75  |
| Second       | ISIP MOY      | 232.96   | 18.42  |
|              | ISIP EOY      | 238.60   | 18.12  |
| Third        | ISIP MOY      | 247.97   | 19.23  |
|              | ISIP EOY      | 251.55   | 19.62  |
|              | STAAR Reading | 1,447.93 | 148.34 |

Table 2: Demographic Description of the Sample for the Correlational Study

# Results

Table 4 shows Pearson product-moment correlations between ISIP ER and STAAR Reading scores. The correlations between ISIP assessments from kindergarten to third grade were high, ranging from 0.59 to 0.89. This indicates a moderate to strong relationship between ISIP ER assessment months. It also indicates how reliable the ISIP assessments were across kindergarten to third grade. The Pearson correlations between ISIP ER and STAAR Reading scores were relatively high, ranging from 0.49 to 0.73. Correlations are lower in kindergarten and first grade, and higher in second and third grade. To be more specific, the correlations were 0.49 and 0.55 in kindergarten, 0.67 and 0.69 in first grade, 0.73 and 0.72 in second grade, and 0.73 and 0.72 in third grade for MOY and EOY assessment months.

Table 4: Pearson Product-Moment Correlations between ISIP ER and STAAR Reading Scores

Note: \*\* = correlation is significant at the 0.01 level (2-tailed)

### Conclusions

ISIP ER scores correlate well across the benchmark periods, and with STAAR Reading scores across grades. ISIP ER scores in higher grades were highly correlated with STAAR Reading scores more than in younger grades, especially in second and third grade. This suggests a deeper analysis between the ISIP ER assessment and STAAR Reading should be further investigated.

# Part II: Linking Study Between STAAR and ISIP ER

After establishing that correlations were strong between the ISIP ER and the STAAR, we next evaluated how well the ISIP ER scores predict students' performance on the STAAR state assessment tests in reading. There are two objectives in this study: (a) using the second grade EOY ISIP ER score to predict the third grade STAAR Reading and (b) using the third grade MOY ISIP ER to predict the third grade STAAR Reading.

STAAR assessments are criterion-referenced tests based on the Texas Essential Knowledge and Skills (TEKS) learning standards. Students' STAAR scores are determined by how well they have mastered grade-specific TEKS standards, rather than comparing their performance to other test takers. The goal is for all students to meet or exceed Texas state standards. STAAR scale score performance levels are used to place students' assessment scores in one of four levels of achievement: level 1 – Did not meet; level 2 – Approaches; level 3 – Meets; or level 4 – Masters. The raw scores, scale scores, and percentile ranks of STAAR Reading performance levels of third grade are presented in Table 5. STAAR performance level 3 identifies whether students pass the assessment or not. If students meet STAAR performance levels 1 or 2, they do not pass the STAAR.

If, on the other hand, students meet STAAR performance levels 3 or 4, then they do pass the STAAR.

| Raw   | Scale | Performance Level              | Percentile |
|-------|-------|--------------------------------|------------|
| Score | Score |                                |            |
| 0     | 769   |                                | 0          |

Table 5: STAAR Reading Performance Levels of Third Grade

#### Measures

The ISIP ER in second and third grades and STAAR Reading in third grade are used in this study. The data were collected from students during the 2018-2019 academic year. Students were in third grade in the 2018-2019 academic year and had MOY ISIP ER scores and STAAR Reading scores from the state test in spring 2019. They were in second grade in the 2017-2018 academic year and had EOY ISIP ER scores from spring 2018 and STAAR Reading in the spring of third grade.

#### Sample

The original data file had 3,410 third grade students in the 2018-2019 school year that had STAAR Reading scores, most of which (3,132) had MOY ISIP ER scores in third grade and STAAR Reading scores. Of these students, 2,681 had EOY ISIP ER scores for their second grade year and STAAR Reading scores in their third grade year.

For second grade, a description of the sample is available in Table 6. Gender was balanced at 49.3% female and 50.7% male students. Most of the students were Hispanic or Latino (58.8%), followed by 24.9% who were Black or African American, 12.4% who were Asian or other races/ethnicities, and 3.9% who were White. Bilingual students comprised 43.6% of the sample, 23.5% were ESL students, 2.4% were identified with dyslexia, 8.4% were enrolled in a special education program, and 6.0% were gifted and talented students. STAAR performance levels for third grade were 35.4% in STAAR performance level 1 – Did not meet; 32.3% in level 2 – Approaches; 13.6% in level 3 – Meets; and 18.2% in level 4 – Masters. Demographics were similar in third grade, and results are also available in Table 6.

|                           | Grade 2<br>N=2,681    | Grade 3<br>N=3,132    |
|---------------------------|-----------------------|-----------------------|
| Gender                    |                       |                       |
| Male                      | 51.1%                 | 51.1%                 |
| Female                    | 48.9%                 | 48.9%                 |
| Race/Ethnicity            |                       |                       |

Table 6: Demographic Composition of the Sample for the Linking Study

The means were 230.02 for second grade's EOY ISIP ER scores and 239.33 for third grade's MOY ISIP ER scores. The means of STAAR Reading scores were 1,405.43 for second grade and 1,400.73 for third grade.

### **Analysis**

We used multinomial logistic regression analysis to determine the probability of reaching a specific level for the STAAR. The ISIP ER scores are the predictor, and the STAAR Reading performance levels are the outcome variable. Students who had ISIP ER scores between the 1st and 99th percentile ranks were included in the analysis. The model is fitted by grade level.

Based on the estimated multinomial logistic regression coefficients, probabilities for the four performance levels are computed for selected ISIP ER scores. A total of 99 ISIP ER scaled scores from EOY of second grade and MOY of third grade are selected, which correspond to the 1st through 99th percentile ranks with an increment of one. For the outcome variable in the multinomial logistic regression, performance levels are defined by STAAR Reading performance level cut points.

The probability of STAAR Reading performance level 2 – Approaches or above is computed by adding the probabilities of levels 2, 3, and 4. The probability of STAAR Reading performance level 3 – Meets or above is computed by adding the probabilities of levels 3 and 4. The probability of STAAR Reading performance level 4 – Masters is the probability of level 4 itself. The analyses were calculated using *R* software with the nnet package.

### Results

#### Second Grade ISIP ER Predicts Third Grade STAAR Reading

Table 7 shows the probability projection of second grade EOY ISIP ER scores and STAAR Reading performance levels. A low probability is defined as a less than 33.3%

chance of attaining a proficiency level, medium probability is defined as between 33.3% and 66.7%, and high probability is defined as greater than 66.7%. All students at the end of their second grade had a high probability of achieving STAAR Reading performance level 2 – Approaches or higher. Students who obtained an ISIP ER score of 232 to 248 (43rd to 75th percentile ranks) had a medium probability of achieving STAAR Reading performance level 3 – Meets or higher. Students who obtained an ISIP ER score greater than 248 had a high probability of achieving STAAR Reading performance level 3 – Meets or higher. Students who obtained an ISIP ER score greater than 248 had a high probability of achieving STAAR Reading performance level 3 – Meets or higher. Students who obtained a score of 245 to 263 (69th to 93rd percentile ranks) had a medium probability of achieving STAAR Reading performance level 4 – Masters. Second graders who obtained an ISIP ER score greater than 263 had a high probability of achieving STAAR Reading performance level 4 – Masters. Second graders who obtained an ISIP ER score greater than 263 had a high probability of achieving STAAR Reading performance level 4 – Masters. Students with an ISIP score of 241 (the 60th percentile) had a 51% probability of achieving Meets or higher.

| ISIP  | Percentile | Approaches | Approaches | Meets | Meets | Masters | Masters |
|-------|------------|------------|------------|-------|-------|---------|---------|

### Using Third Grade MOY ISIP ER Scores to Predict STAAR Reading

Table 8 shows the probability projection of MOY for third grade ISIP ER scores and STAAR Reading performance levels. Students in third grade who obtained an ISIP ER score of 200 to 286 (1st to 99th percentile ranks) had a high probability of achieving STAAR Reading performance level 2 – Approaches or higher. Students who obtained an

ISIP ER score of 242 to 258 (45th to 77th percentile ranks) had a medium probability of achieving STAAR Reading performance level 3 – Meets or higher. Students who obtained an ISIP ER score greater than 258 had a high probability of achieving STAAR Reading performance level 3 – Meets or higher. Moreover, students who obtained an ISIP ER score of 255 to 272 (71st to 93rd percentile ranks) had a medium probability of achieving STAAR performance level 4 – Masters. Students who obtained an ISIP ER score greater than 272 had a high probability of achieving STAAR Reading performance level 4 – Masters. Students who obtained an ISIP ER score greater than 272 had a high probability of achieving STAAR Reading performance level 4 – Masters. Students who achieving STAAR Reading performance level 4 – Masters. Students who achieving STAAR Reading performance level 4 – Masters. Students who achieving STAAR Reading performance level 4 – Masters. Students with a score of 251, at the 63rd percentile, had a 50% probability of achieving Meets or higher.

| ISIP<br>Score | Percentile | Approaches | Approaches<br>Prob | Meets | Meets<br>Prob | Masters | Masters<br>Prob |
|---------------|------------|------------|--------------------|-------|---------------|---------|-----------------|
| 200           | 1          | 0.969      | High               | 0.023 | Low           | 0.002   | Low             |

# Conclusion

The findings from this study give useful information for school administrators, superintendents, teachers, and parents to predict students' performance on STAAR Reading based on their academic achievement as measured by ISIP ER. This information can help teachers identify students who are at risk of not achieving level 3 as early as the end of second grade, giving them an entire academic year to help students perform at grade level as measured by the STAAR assessment. In third grade at the middle of the year, they can also use ISIP to monitor student progress and help provide targeted intervention to students that have a low or medium probability of achieving level 3 – Meets or higher. By providing the low, medium, and high categories, this research gives teachers additional information regarding students that may need critical intervention versus those that may need some additional targeted instruction to help them achieve success on the STAAR.

Overall, students need to achieve near the 45th percentile rank or higher to have a medium probability of meeting STAAR Reading performance level 3 or higher. They need to achieve near the 70th percentile rank or higher to have a medium probability of STAAR Reading performance level 4 – Masters.

# Limitations

The results confirm a that there is a strong relationship between the ISIP ER and STAAR Reading assessments. While the results are promising, it must be understood that complete certainty of passing the STAAR is unknown. There are many other factors that may affect students' STAAR Reading scores besides their reading abilities. Also, this study used ISIP ER scores from EOY of second grade, which is one year before these

students take the STAAR in third grade. It must be understood that students need to continue improving their reading abilities until they take the STAAR Reading test in the spring of third grade. Similarly, their third grade MOY scores are used, which is about three months before they take the STAAR. Students need to continue to improve their reading skills until they take the STAAR in the spring. In addition, the data for this study came from one school district in Texas whose students were in third grade in the 2018-2019 school year. Generalizing these results to other cohorts of students in districts with a different demographic composition, is possible but may be limited.
